

Storage Social

A simple guide for planning product photo and video posts

ONE PLACE FOR YOUR POST IDEAS

Upload product photos, create video posts, write captions, save drafts, schedule the work, and review it before anything is sent.

Open the app

Go to **social.storageaz.com** and sign in with your owner account. The Planner is your starting screen.

Two kinds of posts

Use **Photo post** when you have product pictures. Use **Video post** when you have a finished video file. The two workflows are separate on purpose, so each post gets the right details.

What you will see in the Planner

- **Photo post** and **Video post** buttons at the top.
- Your posts in a list or calendar.
- The Media library for photos and videos you uploaded before.
- Social accounts, approvals, and settings in the left menu.

AI is off

This app does not generate product claims or captions with AI. You write the message, or use the helper to place the exact product details you enter into your caption.

Create a photo post

Use this when you took pictures of a product, a storage unit, a promotion, or an event.

1

Start a new photo post

From the Planner, choose **Photo post**. Give the post a clear internal title, such as “10x15 unit - fall special.”

2

Add product details

Enter what the product is, its key features, price or offer if applicable, and any facts that must be correct. Keep the wording factual and easy to check.

3

Upload your pictures

Drop photos into the upload area or choose them from your computer. You can reuse earlier files from the Media library.

4

Put photos in the best order

Drag pictures to reorder them. Use the crop tool when you need a different framing. Cropping creates a new JPEG copy and keeps the original photo.

5

Write the caption

Write the main caption in your own words. If a platform needs a different version, open the platform caption area and adjust it there.

Before you save

Check the first picture, spelling, prices, dates, phone numbers, and links. A saved draft can be edited later.

Create a video post

Video posting follows a separate path because video platforms may need more information.

1 Start a video post

From the Planner, choose **Video post**. Do not add a video to the photo workflow.

2 Upload the finished video

Choose the video file from your computer. Wait for the upload to finish before leaving the page.

3 Fill in the video details

Add a clear title, the caption or description, and any required platform details. If a destination needs information before it can accept video, the app will show what is missing.

4 Choose destinations

Select the connected social destinations for this post. You can write a different caption for a particular platform when needed.

5 Review and save

Use the preview to check your title, description, selected destinations, and the video file. Save as a draft when it needs another review.

Good video habits

- Keep the first few seconds clear and interesting.
- Use a simple title that explains what the viewer will see.
- Do not promise features, prices, or availability that you cannot confirm.
- Keep the original video file somewhere safe even after uploading it.

Save, review, and schedule

You control when a post is ready. Nothing should be sent by accident.

1

Save a draft

Choose **Save draft** while the post is still being worked on. Drafts stay in the Planner and can be reopened any time.

2

Send for approval, if your workspace uses it

Choose the approval option when another person must review the content. The post will show a status such as pending approval or approved.

3

Set a date and time

Choose the planned date, time, and time zone. The workspace uses the selected time zone when it decides when a scheduled post is due.

4

Check it in the calendar

Switch the Planner to **Calendar** view to see your planned posts by date. Move back to List view when you want to search or filter.

If a post says “Needs attention”

Open the post and read the status details. Common causes are missing required information, an approval that is still waiting, or a social account that needs reconnecting.

Post status at a glance

Status	Meaning
Draft	Still being created. It has not been scheduled or sent.
Pending approval	Waiting for an approver to review it.
Approved / Scheduled	Ready and planned for a future time.
Published / Partial	Sent everywhere selected, or only to some destinations.
Needs attention	Something needs to be fixed before the post can move forward.

Accounts, media, and backups

These areas keep the workspace organized and recoverable.

Social accounts

Open **Social accounts** to review connected destinations. This is where a publishing service and its connected social profiles are managed. When that service is connected, destinations can include Google Business Profile, Facebook, Instagram, Pinterest, TikTok, and YouTube where supported.

Current setup

The workspace is ready to create, save, and schedule content. Live publishing starts only after the publishing service and your social accounts have been connected and tested.

Media library

The Media library stores files you uploaded. Reuse a picture or video instead of uploading it again when it is still appropriate. Keep a separate original copy on your computer or company storage.

Download a full backup

- 1 Open **Settings**.
- 2 Choose **Download full backup**.
- 3 Store the downloaded backup in a private, secure location.
- 4 Do not email the backup or place it in the public GitHub repository.

Why backups matter

A full backup can include your post records, media, user password hashes, and sessions. Treat it as private company data.

A simple daily routine

This routine keeps posting organized without making it complicated.

1 Collect

Take product pictures or finish the video. Keep the original files in your normal company storage.

2 Create

Choose Photo post for pictures or Video post for a completed video. Add only facts you can confirm.

3 Review

Read the caption out loud, check the media order, and confirm the destinations. Ask for approval when needed.

4 Plan

Save as a draft or schedule a date and time. Use the Calendar to avoid putting too many posts on one day.

5 Check

Open the Planner later to make sure scheduled posts still show the right status. Fix any post marked Needs attention.

Quick help

- **Cannot find a post?** Use the search box or status filter in Planner.
- **Need a new version?** Duplicate the post, then edit the copy.
- **Do not want to use a post?** Archive it instead of deleting it.
- **Need to change a photo?** Open the post, replace or reorder media, then save the updated draft.

Remember

Storage Social helps you prepare content in one place. It does not use AI to make claims for you. You remain in control of the message and every scheduled post.
